1 LECTURE 1

Ex 1.1. Consider 12 football players on a football field. Eleven of them are players of F.C. Barcelona, the other one is an arbiter. We select a random player, uniform. This player must take a penalty. The probability that a player of Barcelona scores is 70%, for the arbiter it is 50%. Let $P \in \{A, B\}$ be r.v that corresponds to the selected player, and $S \in \{0, 1\}$ be the score.

1. What is the PMF? In other words, determine $P\{P = B, S = 1\}$ and so on for all possibilities.
2. What is $P\{S = 1\}$? What is $P\{P = B\}$?
3. Show that S and P are dependent.

s.1.1. Here is the joint PMF:

$$P\{P = A, S = 1\} = \frac{1}{12}0.5 \qquad P\{P = A, S = 0\} = \frac{1}{12}0.5 \qquad (1.1)$$

$$P\{P = B, S = 1\} = \frac{11}{12}0.7 \qquad P\{P = B, S = 0\} = \frac{11}{12}0.3. \qquad (1.2)$$

Now the marginal PMFs

$$P\{S = 1\} = P\{P = A, S = 1\} + P\{P = B, S = 1\} = 0.042 + 0.64 = 0.683 = 1 - P\{S = 0\}$$

$$P\{P = B\} = \frac{11}{12} = 1 - P\{P = A\}.$$

For independence we take the definition. In general, for all outcomes x, y we must have that $P\{X = x, Y = y\} = P\{X = x\} P\{Y = y\}$. For our present example, let's check for a particular outcome:

$$P\{P = B, S = 1\} = \frac{11}{12} \cdot 0.7 \neq P\{P = B\} P\{S = 1\} = \frac{11}{12} \cdot 0.683$$

The joint PMF is obviously not the same as the product of the marginals, which implies that P and S are not independent.

An insurance company receives on a certain day two claims $X, Y \geq 0$. We will find the PMF of the loss $Z = X + Y$ under different assumptions.

The joint CDF $F_{X,Y}$ and joint PMF $p_{X,Y}$ are assumed known.

Ex 1.2. Why is it not interesting to consider the case $\{X = 0, Y = 0\}$?

s.1.2. When the claim sizes are 0, then the insurance company does not receive a claim.

Ex 1.3. Find an expression for the PMF of $Z = X + Y$.

s.1.3. By the fundamental bridge,

$$\mathbb{P}\{Z = k\} = \sum_{i,j} I_{i+j=k} p_{X,Y}(i,j) \quad (1.3)$$

$$= \sum_{i,j} I_{i,j \geq 0} I_{j=k-i} p_{X,Y}(i,j) \quad (1.4)$$

$$= \sum_{i=0}^k p_{X,Y}(i, k-i). \quad (1.5)$$

Suppose $p_{X,Y}(i,j) = c I_{i=j} I_{1 \leq i \leq 4}$.

Ex 1.4. What is c ?

s.1.4. $c = 1/4$ because there are just four possible values for i and j .

Ex 1.5. What is $F_X(i)$? What is $F_Y(j)$?

s.1.5. Use marginalization:

$$F_X(k) = F_{X,Y}(k, \infty) = \sum_{i \leq k} \sum_j p_{X,Y}(i, j) \quad (1.6)$$

$$= \frac{1}{4} \sum_{i \leq k} \sum_j I_{i=j} I_{1 \leq i \leq 4} \quad (1.7)$$

$$= \frac{1}{4} \sum_{i \leq k} I_{1 \leq i \leq 4} \quad (1.8)$$

$$= k/4, \quad (1.9)$$

$$F_Y(j) = j/4. \quad (1.10)$$

Ex 1.6. Are X and Y dependent? If so, why, because $1 = F_{X,Y}(4,4) = F_X(4)F_Y(4)$?

s.1.6. The equality in the question must hold for all i, j , not only for $i = j = 4$. If you take $i = j = 1$, you'll see immediately that $F_{X,Y}(1,1) \neq F_X(1)F_Y(1)$:

$$\frac{1}{4} = F_{X,Y}(1,1) \neq F_X(1)F_Y(1) = \frac{1}{4}\frac{1}{4}. \quad (1.11)$$

Ex 1.7. What is $P\{Z = k\}$?

s.1.7. $P\{Z = 2\} = P\{X = 1, Y = 1\} = 1/4 = P\{Z = 4\}$, etc. $P\{Z = k\} = 0$ for $k \notin \{2, 4, 6, 8\}$.

Ex 1.8. What is $V[Z]$?

s.1.8. Here is one approach

$$V[Z] = E[Z^2] - (E[Z])^2 \quad (1.12)$$

$$E[Z^2] = E[(X + Y)^2] = E[X^2] + 2E[XY] + E[Y^2] \quad (1.13)$$

$$(EZ)^2 = (E[X] + E[Y])^2 \quad (1.14)$$

$$= (E[X])^2 + 2E[X]E[Y] + (E[Y])^2 \quad (1.15)$$

$$\Rightarrow \quad (1.16)$$

$$V[Z] = E[Z^2] - (E[Z])^2 \quad (1.17)$$

$$= V[X] + V[Y] + 2(E[XY] - (E[X]E[Y])) \quad (1.18)$$

$$E[XY] = \sum_{ij} ij p_{X,Y}(i, j) = \frac{1}{4}(1 + 4 + 9 + 16) = \dots \quad (1.19)$$

$$E[X^2] = \dots \quad (1.20)$$

The numbers are for you to compute.

Now take X, Y iid $\sim \text{Unif}(\{1, 2, 3, 4\})$ (so now no longer $p_{X,Y}(i, j) = I_{i=j} I_{1 \leq i \leq 4}$).

Ex 1.9. What is $P\{Z = 4\}$?

s.1.9.

$$P\{Z = 4\} = \sum_{i,j} I_{i+j=4} p_{X,Y}(i, j) \quad (1.21)$$

$$= \sum_{i=1}^4 \sum_{j=1}^4 I_{j=4-i} \frac{1}{16} \quad (1.22)$$

$$= \sum_{i=1}^3 \frac{1}{16} \quad (1.23)$$

$$= \frac{3}{16}. \quad (1.24)$$

Remark 1.10. We can make lots of variations on this theme.

1. Let $X \in \{1, 2, 3\}$ and $Y \in \{1, 2, 3, 4\}$.
2. Take $X \sim \text{Pois}(\lambda)$ and $Y \sim \text{Pois}(\mu)$. (Use the chicken-egg story)
3. We can make X and Y such that they are (both) continuous, i.e., have densities. The conceptual ideas¹ don't change much, except that the summations become integrals.
4. Why do people often/sometimes (?) model the claim sizes as iid $\sim \text{Norm}(\mu, \sigma^2)$? There is a slight problem with this model (can real claim sizes be negative?), but what is the way out?
5. The example is more versatile than you might think. Here is another interpretation.

A supermarket has 5 packets of rice on the shelf. Two customers buy rice, with amounts X and Y . What is the probability of a lost sale, i.e., $P\{X + Y > 5\}$? What is the expected amount lost, i.e., $E[\max\{X + Y - 5, 0\}]$?

¹ Unless you start digging deeper. Then things change drastically, but we skip this technical stuff.

Here is yet another. Two patients arrive in to the first aid of a hospital. They need X and Y amounts of service, and there is one doctor. When both patients arrive at 2 pm, what is the probability that the doctor has work in overtime (after 5 pm), i.e., $P\{X + Y > 5 - 2\}$?

Ex 1.11. We have a continuous r.v. $X \geq 0$ with finite expectation. Use 2D integration and indicators to prove that

$$E[X] = \int_0^\infty x f(x) dx = \int_0^\infty G(x) dx, \quad (1.25)$$

where $G(x)$ is the survival function.

h.1.11. Check the proof of BH.4.4.8

s.1.11. The trick is to realize that $x = \int_0^\infty I_{y \leq x} \, dy$. Using this,

$$\mathbb{E}[X] = \int_0^\infty x f(x) \, dx \tag{1.26}$$

$$= \int_0^\infty \int_0^\infty I_{y \leq x} f(x) \, dy \, dx \tag{1.27}$$

$$= \int_0^\infty \int_0^\infty I_{y \leq x} f(x) \, dx \, dy \tag{1.28}$$

$$= \int_0^\infty \int_0^\infty I_{x \geq y} f(x) \, dx \, dy \tag{1.29}$$

$$= \int_0^\infty \int_y^\infty f(x) \, dx \, dy \tag{1.30}$$

$$= \int_0^\infty G(y) \, dy. \tag{1.31}$$

Ex 1.12. A variation on BH.7.1. Alice is prepared to wait 20 minutes for Bob, while Bob doesn't want to wait longer than 10 minutes. What is the probability that they meet?

Use the fundamental bridge and indicator functions to write this probability as a 2D integral. Then use repeated integration to solve the 2D integral.

s.1.12. Let A, B be the arrival times of Alice and Bob. They meet if $I_{A < B + 1/3} I_{B < A + 1/6}$ is true, i.e., is equal to 1. Therefore, by letting M be the event that they meet:

$$P\{M\} = E[I_{A < B + 1/3} I_{B < A + 1/6}] = \int_0^1 \int_0^1 I_{x < y + 1/3} I_{y < x + 1/6} dy dx.$$

We can solve this integral by first integrating along y , and then along x . Let's focus on the integral over y first.

$$\begin{aligned} \int_0^1 I_{x < y + 1/3} I_{y < x + 1/6} dy &= \int_0^1 I_{x - 1/3 < y < x + 1/6} dy \\ &= \int_0^1 I_{\max\{0, x - 1/3\} < y < \min\{1, x + 1/6\}} dy \\ &= \min\{1, x + 1/6\} - \max\{0, x - 1/3\} \end{aligned}$$

Now the integral over x :

$$\begin{aligned}
 \int_0^1 (\min\{1, x + 1/6\} - \max\{0, x - 1/3\}) dx &= \int_0^1 \min\{1, x + 1/6\} dx - \int_0^1 \max\{0, x - 1/3\} dx \\
 &= \int_0^{5/6} (x + 1/6) dx + \int_{5/6}^1 1 dx - \int_{1/3}^1 (x - 1/3) dx \\
 &= 0.5x^2 \Big|_0^{5/6} + 1/6 \cdot 5/6 - 0.5x^2 \Big|_{1/3}^1 + 1/3 \cdot 2/3
 \end{aligned}$$

Of course, we can find the probability with some simple geometric arguments (compute the area of two triangles). However, this does not work any longer if the density is not uniform. Then we have to do the integration, and that is the reason why I show above how to handle the general case.
